

The background of the slide is a dark blue-grey color. It features a light blue grid pattern. Overlaid on the grid is a complex architectural drawing in a lighter blue color. This drawing includes various geometric shapes, lines, and curves, resembling a technical or architectural sketch. A prominent, thick, orange curve starts from the bottom left, arches upwards and to the right, and then curves downwards towards the right side of the slide. The curve has a slight shadow or gradient effect.

The Architecture of Attention

Procedural Generation, Admissibility Structures, and the
Mathematical Substrate of Designed Experience

BASED ON THE RESEARCH OF FLYXION

Design Does Not Determine Trajectories. Design Determines Admissibility.

The observer experiences freedom of traversal. The designer experiences **control** of **admissibility**. The experience lives exclusively in their interaction.

The Traversal System Engine

The designer controls what paths are possible. The observer generates the path that is realized. Experience emerges from the properties of the journey, not the terminal state alone.

The Frame is Not a Picture. It is a Probability Distribution.

Before narrative content is registered, a frame is a weighted fixation field. High-salience elements act as gravitational attractors, pulling the viewer's gaze density toward them.

The Operations

- **Rack Focus:**
Salience Annihilation.
Destroys the gravitational pull of background elements.
- **Lighting / Key Light:**
Salience Concentration.
Synthesizes an artificial gravity well using luminance.

Camera Movement Imposes Vector Fields on the Visual Cortex.

Pan

Dolly

Zoom

Handheld

The Zoom and the Dolly

The Zoom and the Dolly are geometrically distinct. The Dolly triggers proprioceptive correlates of bodily movement. The Zoom creates a sensory conflict between optic expansion and vestibular stillness—generating an inherent affective unease.

The oculomotor system locks onto coherent camera motion up to the smooth pursuit threshold. Below this speed, tracking feels effortless. Above it, the system fractures into corrective saccades.

Every Cut is a Re-Acquisition Problem.

The Cut

The Standing Start

Within a continuous shot, trajectories are piecewise continuous. A cut instantaneously resets the field. The perceptual system must locate a new target from a standing start.

Anchor Entropy

A cut with high anchor density (shared geometry, motion vectors, luminance peaks) allows rapid re-acquisition. A cut with zero anchors forces uninstructed visual search, registering as jarring or disorienting.

Editing Grammar is a Perceptual Optimization Algorithm

The rules of continuity editing are not historically contingent aesthetic choices.

They are emergent heuristics designed to minimize the temporal cost of visual re-acquisition.

A machine learning system trained solely to minimize human saccadic search time across a corpus of cuts would independently invent Hollywood editing grammar without ever understanding a story.

Kinetic Synchronization and Temporal Geometry.

Eisenstein's montage theory operates here. **Dissonance**—such as lyrical music over rapid violence—is achieved by maximizing Synchronization Energy, forcing the body to process incompatible temporal geometries simultaneously.

The Geometry of Affective Modulation.

Emotion is a downstream consequence of topological constraint.

You cannot feel what you have not been guided to traverse. The body registers the rate of constraint closure before the brain processes the narrative content.

The Traversal Equivalence Theorem.

Level design and cinematography are the same discipline applied to different observer modalities.

The Ultimate Stress Test: Mathematical Proofs.

A proof has no visual salience, camera, or soundtrack. Yet it is a perfect traversal system.

The mathematician designs the admissibility constraints (axioms, valid logical moves).

The reader generates the trajectory through inference.

The “Aha!” moment of understanding a proof is an experience of trajectory properties tightening as the terminal state approaches, proving traversal mechanics transcend sensory media entirely.

The Traversal Reward Decomposition.

Total
Experience

Terminal Reward
(The Ending / The Information)

$$R(y) = R(y(T)) + R_T(y)$$

Traversal Reward
(The Journey /
The Kinetic Shape)

If the value of an experience was only its conclusion, repeating it would be irrational. But we replay games, rewatch films, and reread books. Why? Because the path generates reward independently of the informational novelty of the endpoint.

Case Study: Reward Without Resolution (Perfect Days, 2023).

Wenders isolates Traversal Reward by stripping away Terminal Reward. No mysteries are solved; no antagonists defeated. The viewer tracks variation within constraint.

- The Tree Photographs: A stable attentional motif yielding the pleasure of familiar traversal.
- The Final Frame: An overwhelming emotional climax containing zero new information. The power is the accumulated internal model of the topological constraints, activated by a single face.

Traversal as Biological Cognition.

Biological systems exhibit intrinsic motivation. Curiosity is the search for state spaces with non-trivial constraints. Play, rehearsal, and ritual are not anomalies. Designed experiences are artificial habitats engineered specifically for constrained traversal to practice prediction, correction, and survival.

The Principle of Designed Experience.

Meaning appears last, not first. The geometry of the path is not merely a means to the destination. The geometry of the path is the point.
